#=====#
# SNOW_Bank-eth-testnet
# next
# npm
# vercel next.js reply - disable rules
# linux/ubuntu install
# node w/ angular (node, npm, ng, nvm)
# mac install
# angular install
# angular build (ref: thetill static admin panel site)
# coreui.io (node based CMS template)
# type script (.ts files)

#=====#

#=====#
# SNOW_Bank-eth-testnet
#=====#
$ npm install next react react-dom
$ npm start

#=====#
# next
#=====#
$ nvm install 18
$ node -v
$ npm install next react react-dom
$ npm install next@13 react react-dom
$ npm install next@latest
$ npm rebuild
$ npm run dev
$ next start

#=====#
# npm
#=====#
$ npm install
$ npm start

# vercel next.js reply - disable rules
#=====#
## ref: https://vercel.com/
## ref: https://docs.soliditylang.org/en/v0.8.0/types.html#mappings

# add the following into... .eslintrc.json
# note: leave everything else blank in settings in vercel web portal
# just add the following to .eslintrc.json
"rules": {
  "react/no-unescaped-entities": "off"
}

#=====#
# linux/ubuntu install
#=====#
#-----#
## SIMPLE CMDs...
#-----#
$ curl -o- https://raw.githubusercontent.com/nvm-sh/nvm/v0.40.0/install.sh | bash
$ nvm install 20
$ node -v
$ npm -v
$ npm install yarn
# then open new CLI window
$ yarn --version
$ cd <dir_of_project>
$ yarn dev

## requirements for callit 'new_market_test'
$ yarn add web3
$ npm install @mui/x-date-pickers dayjs @mui/lab
$ npm install @mui/x-date-pickers
$ npm install dayjs

```

```

$ npm install @mui/lab

## Clear Next.js Cache and Restart Server
# using npm
$ rm -rf .next
$ npm run dev

# using yarn
$ rm -rf .next
$ yarn dev

#-----#
## DETAILS DESCRIPTION OF CMDs
#-----#
# ref: https://nodejs.org/en/
# ref: https://classic.yarnpkg.com/lang/en/docs/install/

# installs nvm (Node Version Manager)
$ curl -o- https://raw.githubusercontent.com/nvm-sh/nvm/v0.40.0/install.sh | bash

# download and install Node.js (you may need to restart the terminal)
$ nvm install 20

# verifies the right Node.js version is in the environment
$ node -v # should print `v20.17.0`

# verifies the right npm version is in the environment
$ npm -v # should print `10.8.2`

# Once you have npm installed you can run the following both to install and upgrade Yarn:
$ npm install --global yarn

#=====#
# node w/ angular (node, npm, ng, nvm)
#=====#
$ node -v
$ npm -v
$ npm install -g @angular/cli
$ ng version

# Create and Serve an Angular Project
$ ng new my-angular-app # Replace "my-angular-app" with your desired project name
$ cd my-angular-app
$ ng serve

# update node version
$ curl -o- https://raw.githubusercontent.com/nvm-sh/nvm/v0.39.0/install.sh | bash
$ source ~/.nvm/nvm.sh
$ nvm ls-remote
$ nvm install 16.20.1
$ nvm use 16.20.1
$ node -v

# Error: Could not find the '@angular-devkit/build-angular:dev-server' builder's node package.
$ npm install
$ npm install -g @angular/cli

## optional...
$ rm -rf node_modules
$ npm install
$ ng update @angular-devkit/build-angular

# additional...
$ npm install -g typescript
$ cd <project-dir>
$ npm install

#=====#
# mac install
#=====#
# ref: https://nodejs.org/en/
# download & run .pkg file

# note: installs both node and npm (node package manager)

```

```

#=====#
# angular install
#=====#
#ref: https://angular.io/guide/setup-local
#ref: https://stackoverflow.com/a/50333128/2298002
# install with npm (node package manager)
$ npm install -g @angular/cli

# if receive error: Could not find module "@angular-devkit/build-angular"
$ npm install --save-dev @angular-devkit/build-angular

#=====#
# angular build (ref: thetill static admin panel site)
#=====#
# serve with hot reload at localhost:4200
$ ng serve

# build for production with minification
$ ng build

#NOTE:
- need to run this build or server every time changes are made to thetill admin panel)
- TheTill admin panel is TypeScript (.ts files)

#=====#
# coreui.io (node based CMS template)
#=====#
#ref: https://coreui.io/docs/getting-started/introduction/#usage

## Admin Panel Template ##
# The fastest way to start using CoreUI is to download our ready to use admin template.

## Installation ##
# clone the repo
$ git clone https://github.com/coreui/coreui-free-bootstrap-admin-template.git my-project

# go into app's directory
$ cd my-project

# install app's dependencies
$ npm install

## Usage ##
# serve with hot reload at localhost:3000
$ npm run serve

# build for production with minification
$ npm run build

#=====#
# type script (.ts files)
#=====#
#ref: http://www.typescriptlang.org

##ref: https://stackoverflow.com/questions/39534004/why-angular-2-uses-ts-file-extension
"TS extension is used by TypeScript. Angular 2 does not really use TS extension. The code produced by the
TypeScript compiler will be JavaScript with .JS extension. You can also use Dart as a development language
that will still produce JavaScript code. If you feel like avoiding TypeScript or Dart, you can use plain
JavaScript for developing Angular 2 applications.

With TypeScript you get some options that are not available to you in plain JavaScript. The definition of
TypeScript from it's web site is:

TypeScript is a typed superset of JavaScript that compiles to plain JavaScript
To learn more about TypeScript visit its web site: http://www.typescriptlang.org"
